OBJECTIVE

AWS Certified Solutions Architect with 2.5+ years of experience designing and delivering cloud-native systems on AWS. Specialized in distributed system design, multi-tenant SaaS architecture, fault-tolerant payment infrastructure, and real-time data platforms, backed by deep hands-on DevOps foundations in CI/CD, containerization, and Infrastructure as Code. Architected platforms serving 10,000+ concurrent users and payment systems processing \$5M+ in transaction volume, while improving deployment efficiency by up to 70% and ensuring high availability, security compliance, and cost optimization.

EDUCATION

B.Tech in Computer Engineering, P.P Savani University 2021 - 2024

Diploma in Computer Science, A.Y DADABHAI POLYTECHNIC INSTITUTE 2018 - 2021

CERTIFICATIONS

AWS Certified Solutions Architect, Associate [Verify on Credly](#)
Amazon Web Services

SKILLS

System Design & Architecture	Multi-Tenant SaaS, Microservices, Event-Driven Systems, Fault Tolerance, D
Cloud Technology	AWS (Lambda, Step Functions, API Gateway, ECS, RDS, DRS, KMS)
Containerization & Orchestration	Docker, ECS Fargate
Infrastructure as Code (IaC)	Terraform, CloudFormation
CI/CD Tools	Jenkins, GitHub Actions, GitLab CI/CD, AWS DevOps
Configuration Management	Ansible
Scripting & Automation	Shell Scripting, Python, AWS CLI, Lambda Functions
Database Management	MySQL, MongoDB
Data & Real-Time Analytics	Apache Doris, Kafka, AWS Athena, AWS QuickSight
API Technologies	REST APIs, GraphQL, MCP (Model Context Protocol)
AI/Agentic Systems	LangChain, Google Gemini, Multi-Agent Workflows, RAG, Human-in-the-Lo
Security & PKI	IAM, WAF, GuardDuty, CIS Benchmarks, X.509 PKI, IAM Roles Anywhere
Logging & Monitoring	AWS CloudWatch, Grafana, Prometheus
Version Control	Git, GitHub
Others	Linux, Troubleshooting, Blogging

EXPERIENCE

Solutions Architect Jan 2024 - Present
Electromech Cloudtech Pvt. Ltd *Ahmedabad, Gujarat, India (Hybrid)*

- **Multi-Tenant SaaS Architecture:** Architected a multi-tenant, Shopify-like e-commerce platform from the ground up, now serving **10,000+ concurrent users**. Data-layer tenant isolation and horizontally scalable compute removed the need for per-tenant infrastructure entirely.
- **Payment Gateway Architecture:** Designed a fault-tolerant, horizontally scalable payment gateway processing **\$5M+ in transaction volume** under heavy concurrent load, using idempotent request handling, queue-based load leveling, and multi-AZ failover to stay consistent through traffic spikes.
- **Zero-Loss Database Migration:** Led AWS DMS migrations of live production databases with **zero record loss**, using continuous CDC replication and a full row-level validation pass before cutover, keeping the source system serving traffic throughout.

- **Real-Time Analytics Platform:** Deployed and provisioned Apache Doris across roughly **5TB of data**, powering real-time analytics dashboards over high-cardinality datasets that had previously bottlenecked the existing warehouse.
- **Serverless Disaster Recovery:** Architected automated DR for a SaaS platform using Python Lambda functions orchestrated through AWS Step Functions and AWS DRS, enabling one-click failover and failback with minimal downtime.
- **Platform Engineering & Operations:** Delivered the surrounding cloud foundation across enterprise and startup environments: serverless geofence APIs on Lambda and API Gateway with GraphQL, monolith to containerized ECS Fargate modernization with CloudFront delivery, CI/CD automation via CodePipeline and GitLab, Terraform and CloudFormation IaC for one-click provisioning, security hardening with WAF, IAM least-privilege, CIS benchmarks and GuardDuty including live DDoS mitigation, Grafana and Prometheus observability with Slack alerting, and deep troubleshooting across EC2, ECS, Lambda, and databases.

PERSONAL PROJECTS

- **Builder of [ExamWarp](#):** An AI-powered SaaS platform helping students prepare for exams with smart study tools and practice tests. Shipped end to end on free-tier infrastructure, frontend on Vercel and backend on Render, with a Google Gemini 2.5 Flash key fallback chain that keeps generation running when a key hits its rate limit.
- **Multi-Agent Workflow System:** Built a multi-agent workflow with human-in-the-loop checkpoints for high-stakes decisions, using the Saga pattern to keep distributed transactions consistent across agent steps, plus a LangChain-based memory layer that cuts token usage on long-running sessions.
- **AWS Pricing Calculator (MCP Server):** Built an AWS cost calculator exposed as an MCP (Model Context Protocol) server, letting AI agents query live AWS pricing programmatically and generate shareable cost-breakdown links.
- **Self-Hosted CA, an IAM Roles Anywhere Alternative:** Designed a self-hosted certificate authority rooted in AWS KMS as a lower-cost alternative to AWS Private CA, issuing and rotating short-lived X.509 certificates for hybrid and on-premise workload identity.

EXTRA-CURRICULAR ACTIVITIES

- Contribute technical articles on [Medium](#), covering topics related to AWS, DevOps automation, cloud security, and infrastructure optimization.
- Passionate about literature, write poetry and enjoy reading novels across different genres.
- Competed at the **national level** in football, demonstrating teamwork, strategy, and resilience on the field.
- Participated in the **AWS Amplify Hackathon**, contributing to the project **Savvy Nurse**, where I worked on setting up AWS Amplify for seamless front-end and back-end integration. [[Hackathon Link](#)].
